SignDex

SIGNDEX | SignDex vs. Adobe Sign

Digital signing for your business.
Your storage. Your signing identity. Your workflow.

Every signer gets a certificate-based digital signature as standard with SignDex.

SIDE BY SIDE

SignDex

WHY CHOOSE SIGNDEX

Individual signatures. Identity checks. Better value

Your documents, your storage

Organisation admins can configure company-owned cloud file storage, such as Azure Blob Storage, Amazon S3 or other cloud file-storage services, to align document storage with company requirements.

A certificate-based signature for every signer

Each signer applies an individual certificate-based digital signature by default. Organisations can request built-in e-KYC checks for standard signing too; verification is required for Trusted ID signing.

HOW THEY DIFFER

More control over storage and signing choices

SignDex includes a certificate-based digital signature for every signer by default. Adobe Acrobat's standard e-signatures use initials, a typed signature or an image of a signature, supported by an audit trail with timestamps; digital signatures are available in Acrobat Pro.

SignDex: individual signatures as standard

Data residency in your control
Your data is stored on local servers in Malaysia, so it stays in-country.

- Certificate-based signature for every signer, included by default
- Sequential, parallel and quorum signing
- Bring Your Own Storage
- Built-in e-KYC for standard and Trusted ID signing

Adobe Acrobat Sign: a PDF and e-signature suite

Data hosting location
Acrobat Sign data centres are in Australia, Europe, India, Japan and the US; Malaysia is not listed.

- Typed, drawn or image e-signatures by default; certificate-based signing needs a digital ID or paid cloud provider
- Sequential and parallel signing; hybrid and group signing need Sign Solutions plans
- Documents stored in Adobe's cloud on AWS and Microsoft Azure
- Phone and KBA checks only on Sign Solutions plans, charged per use; KBA is US-only
